

ZRobo

METER READING software

FOR ANDROID BASED DEVICES

ZRobo is the special designed version of REDZ ZR Electronic Electricity Meter Reading Software to be able to use with Android based devices. The software is especially designed to be used with REDZ optical probes. Android based ZRobo Software supports Android 4.0 and higher versions (since it uses USB Host and Bluetooth connectivity).

ZRobo software presents the most important tools for meter reading with an optimized and practical interface design. It lets meter service engineers to use Android based, daily used mobile devices rather than heavy and hard to carry computers in order to read meters in the field applications. ZRobo Software can use both serial cable connection over USB and Bluetooth connection in order to establish connection with the optical probe. Thanks to custom software design infrastructure, without any need of extra configuration, data of any meter that communicates in IEC62056-21 (formerly known as IEC1107) can instantly be read and can be saved as text file.

The software comes in English, Turkish and Italian Language options. It is also possible to easily implement different language options to the system according to the user needs. Source code of the ZRobo Software is also available, based on mutual agreement on the project.
